Anansi Green Energy to deliver green electricity via new renewable energy platform

By Dr. Christoph KAPP

Anansi Green Energy

The Swiss renewable energy company NEK Umwelttechnik AG (NEK) has been developing in the past years six large-scale onshore wind farms in the Greater Accra Region of Ghana, which are ready for implementation.

The total capacity to be installed is approximately 1,300 MW through the six projects. These wind farms could produce about 3,400 GWh of green and cheap electricity each year for the Ghanaian population and the industrial sector.

To supply energy to as many customers as possible, NEK has established recently in Accra a new renewable energy platform, which will provide to its customers cheap, sustainable, never ending, and clean electricity to cover the increasing electricity demand in Ghana and to overcome dumsor. The platform is called Anansi Green Energy Ltd. (Anansi). Anansi will assume, over time, all of NEK's wind farms and in addition will also undertake the development and operation of solar and biomass plants.

This new platform will have several equity partners, lenders, and investors, including large and well-known international power companies and green funds. Ghanaian investors, lenders and key stakeholders and institutions will also be involved in the implementation and financing of Anansi.

The platform will act as a "captive" industrial power generator by selling the green electricity directly to industrial off-takers. It is hoped, in the future, Anansi will be the vehicle through which Ghana can become a renewable hub for West Africa as a whole by also exporting renewable energy through the existing WAPP network to surrounding countries.

A lot of interested customers

Anansi is now starting to discuss terms with several interested customers for the delivery of green electricity. The future demand both in the country and in surrounding markets for green energy will likely grow significantly.

Although there will always be a need for baseload energy capacity in the planning

Figure 1: Visualisation of one of NEK's planned wind energy projects in Ghana which will be integrated into the Anansi Green Energy Platform

Figure 3: Visualisation of another one of NEK's wind energy projects in Ghana. The onshore projects alone could amount up to 1,300 MW installed capacity and are located predominantly in rural areas

Asabanti. One of the big mining companies in Ghana which could be provided with clean energy through the Anansi Green Energy Platform. Source: <https://www.angogoldasbanti.com/>

Figure 4: Ghana presents a good opportunity to integrate different renewable energy sources into one package. While the coastal region offers good wind conditions (here is one of NEK's met masts in Konikablo, Ghana, measuring the wind potential), it also offers adequate solar resources for the installation of Solar PV

Figure 5: With ongoing rural and urban development in Ghana, demand for mobility will increase even more in the coming years. The Anansi Green Energy Platform would be uniquely equipped to provide clean energy to an emerging e-mobility sector in Ghana. Here, a boundary survey is taking place as part of the project development work in connection with the planned wind farms of NEK

of any energy sector, both for environmental and indeed affordability reasons it will be essential to create a structure through which renewable energy can be developed, without such relying on the public sector. Mining companies, the concrete sector, steel manufacturers, but also other industries and the mobility sector will demand cheap and green electricity, which can be delivered by Anansi in the very near future.

No competition to VRA or ECG and no reliance on Government of Ghana

Anansi will not become a competitor to ECG, VRA or NEDCo - nor will it be necessary for Anansi to have the traditional "take or pay" PPA with ECG or any support from the Government of Ghana. Anansi will be able to implement its projects without any reliance on the public sector at all. Indeed, the intent will be that Anansi will have, as its partners, VRA / ECG in providing baseload capacity to its customers.

Green Energy as a Megatrend

Green energy is enjoying unanimous support and gaining political and business momentum around the globe. The global energy sector is in the midst of a transformation.

The global energy transition is now well underway, with ever-increasing clean energy investment and

momentum for net-zero targets by mid-century. Energy security and sustainability nowadays go hand in hand and are top of the agenda for many governments worldwide.

Africa is no exception, with the continent facing rapidly growing energy demand, critical energy access gaps, and an imperative for development. Africa's imperative to accelerate its socio-economic development in a resilient and sustainable way could immensely benefit from accelerating clean energy deployment, as was stated at the COP28 summit last December.

Failing to accelerate the development of renewables poses major threats to the continent already suffering the most from the impacts of climate change. Yet, while global renewable energy investments are reaching record-high levels, renewables are still critically underfunded in Africa, signalling urgent work ahead. This also applies for Ghana: Ghana's energy outlook shows an exponential soaring of future energy demand.

Thermal generation continues to require high-cost fuel and remains subject to the risks inherent in the ability for such fuel to be continuously delivered. Ghana will require an accelerated development of

Political, Violence and Terrorism (PVT) and Cyber Safety

... *Visal Reinsurance brokers hosts training in Sogakope*

To address the dual challenges of Political Violence Insurance and Cyber threats within the insurance industry, Visal Reinsurance Brokers Ltd (Visal RE) organized a comprehensive two-day training session at the Sogakope Beach Resort and Spa in Sogakope, Volta Region. The event, which brought together participants from insurance companies across West Africa, highlighted the pressing need for proactive measures to mitigate these risks in today's rapidly evolving landscape.

The training sessions

were led by seasoned experts in PVT and Cyber Security Josh Hearnden from Mosaic Insurance, UAE, and Cole Baidoo of Comfy Technology respectively. Mr. Hearnden and Mr. Baidoo provided attendees with valuable and practical insights on underwriting Political Violence and Terrorism insurance and cyber security awareness within the insurance industry.

Day one of the training focused on understanding the dynamics of PVT insurance, underwriting guidelines, and its potential implications for businesses and communities. Participants were briefed on the various forms of policy

extensions under PVT. Through case studies and interactive discussions, attendees gained a deeper understanding of the factors driving PVT insurance and learned how to assess and underwrite associated risks effectively.

Day two focused on the realm of cyber security, highlighting the growing threat facing organizations in an increasingly digitized world. The facilitator, Cole Baidoo indicated that cyber attacks are becoming more sophisticated and pervasive, hence the need for proactive measures to protect against data breaches, ransomware,

and other cyber threats.

Attendees were introduced to key concepts and best practices in cyber security, including threat detection, incident response, and data protection strategies. Through hands-on exercises and simulations, participants gained practical experience in identifying vulnerabilities, implementing security controls, and mitigating cyber risks effectively.

One of the key takeaways from the training was the interconnected nature of political violence and cyber threats, with malicious actors often exploiting political unrest as a smokescreen for cyber-attacks which can have financial consequences. By adopting a holistic approach to risk management, organizations can better safeguard their operations and minimize vulnerabilities in both the physical and digital domains.

Speaking at the event, Mr. Vincent Sali-Dorkpor, Director at Visal RE, emphasized the company's commitment to fostering collaboration and knowledge-sharing. Initiatives such as these play a crucial role in strengthening the fabric of our industry.

The Managing Director of the firm, Mr. Sam Sali, also spoke about the importance of

the training.

For him, the gathering of experts and other stakeholders represents a proactive approach toward enhancing preparedness and resilience in the face of political violence and cyber threats.

The Political, Violence, and Terrorism (PVT) and Cyber Safety training is the first phase of a series of training the company will be embarking on with stakeholders of the insurance industry.

Anansi Green Energy to deliver green electricity via new renewable energy platform

Continued on next page

renewable energy, but it will not be able to do so if there remains a reliance on typical grid connected IPP's with ECG as the sole off-taker and with full Government backing. It is not possible or reasonable for the public sector itself to assume such risks going forward.

A different rule book now needs to be written, and Anansi has the potential to provide that new way forward right away.

VALCO modernization and expansion plans

Volta Aluminum Company Limited (VALCO) has announced its plan to expand operations and seek a strategic partner which would be prepared to invest around USD 600 million to revamp its operations.

The goal is to reposition VALCO in a way that retrofitting will transform it from a loss-making entity into a best-in-class, profit-making and shareholder value-maximising entity, thus

big on the coast of Ningo and Anloga combined with existing plants, which will be constructed by Anansi off the coasts of Ningo and Anloga will require more than 1,000 MW of installed electrical power. "Where do we take this from?"

With the projection of the building of 4 operating bauxite mines and 2 refineries under the IAI Masterplan as well as the revival of the downstream sector, the modernisation and expansion of the VALCO smelter is timely, thus creating a new VALCO with much more significance than ever before.

However, such plans require a lot of additional electricity, which at least for the time being is not available in Ghana. It is estimated that at the end of the retrofitting and extension program, VALCO

The volume of green electricity required by VALCO will be significant with the realistic and probably only solution being the electricity capable of being produced by Anansi. Anansi will look forward to creating a partnership with VALCO and VRA, which could allow VALCO to attract international investment which will require such available green electricity and will also otherwise allow VRA to significantly expand its

Green Energy, Green Hydrogen and E-Mobility

Green energy from NEK's wind farms, as well as other solar plants and biomass facilities through Anansi will provide the cheapest generation costs for electricity in Ghana.

While fossil power plants produce energy at approximately 15 US Cents per

kWh, NEK's wind farms will produce energy for less than 8 US Cents per kWh in current pricing. There are possible further savings to these costs as well through the application of carbon credits.

The renewable projects to be developed by Anansi will be long term and allow for certainty as to the all-in cost of energy as there will be no relevance or risk for possible fuel price shocks going forward. The available wind and solar irradiation will remain free, and Anansi's customers will be able to benefit from such.

In addition to green energy, Ghana should consider developing a 'Green Hydrogen and Green Fuels' and an 'E-Mobility' policy. The Government should consider key strategies and relevant road maps for the development of the "energy carrier" in the future.

Green hydrogen and electric vehicles will need significant renewable resources to be available, otherwise, they cannot be called green. A strong political signal will trigger huge investments from abroad in the energy sector of Ghana and business activities relating to these future markets. The key for doing so is the implementation of renewable energy projects.

Outlook

Due to the heavily increasing demand for cheap and clean electricity in Ghana and abroad, much more renewable energy even than that capable of being produced in NEK's planned 6 onshore windfarms, and the other planned Anansi solar projects and biomass facilities will be required within the next 5 - 10 years.

However, land for such further projects may also become a scarce asset, especially in populated areas. This is one of the reasons why NEK has decided to start the development of two (2) large offshore wind and solar facilities off the coast of Anloga and Ningo.

These offshore wind and solar parks will have an installed capacity of approximately 3,100 MW and will generate more than 7,500 GWh of clean and reliable power per year. These installations do not require any fuel, LNG, gas, oil or other fossil, outdated energy sources - the "fuel" is the wind and the sun, which are never ending, home-made and always coming back to Ghana for free.

Anansi Green Energy will play a huge role in the delivery of much needed green energy for Ghana already in the very near future. Now is the time for Anansi to create its positive green web in delivering sustainable and affordable energy to its customers, making Ghana a renewable energy hub in West Africa.
